

CleanCase Hidden Plunger™

By FlexCart™

We spent thousands of hours talking with maintenance professionals about their work. One of the most commonly discussed issues is the uncomfortable nature of transporting a plunger through their facility, which is generally done either in a bucket or a trash bag. In both cases, it is obvious to the guest, patient or resident what the Engineer is carrying, which causes an uncomfortable situation for them both. The CleanCase Hidden Plunger™ is a brand-new approach to the plunger and how it is carried and used in a facility environment. It **cleverly disguises our specially designed plunger** by carrying it upside-down in a unique case allowing it to be transported through a facility without anyone noticing. The CleanCase™ also carries the plunger in a **more sanitary** way, first by covering the plunger head with a disposable plastic bag and then by encapsulating it in our patent-pending case. Each CleanCase™ comes with 30 disposable plunger head bags, which are also available for purchase separately (FlexCart PN CC-100PHB120). The included unique plunger tool is innovatively designed to be **a more professional, better functioning tool**. It has a high-quality plunging head and a comfortable, padded, ergonomic handle that extends to a length of 25" (normal handles are 17") keeping the operator back and away from the problem they are addressing.
